

Coronavirus vaccination

The vaccines

The vaccine is effective!

© istockphoto.com/ luza studios

Different vaccine types – same effect!

This is how vaccination protects: The immune system reacts to the **spike protein** of the coronavirus and produces **antibodies and immune cells** that **protect against severe disease**.

No interference with human genetic material!

mRNA and vector vaccines are also classified as inactivated vaccines. They do not affect the human genome (DNA).

Prevention is the best protection!

The approved COVID-19 medications are **not a substitute for vaccination**. Follow the current vaccination recommendations to maintain the **best protection** for yourself.
